

31 July 2026

Attn:

Continuous Professional Development
Faculty of Engineering, Monash University Clayton VIC 3800

This is to certify that Coen Pasitchnyj worked at Telstra from 01/02/24 to 31/07/26 for a total of approximately 2300 hours in total. Their job title was Edge Undergraduate Network Engineer.

During the employment period, Coen's job involved the following:

Network Technology and Commercial Development (Jan 2024 – Jun 2025)

Contribute to the development of network procurement and sourcing activities (RFx processes) by supporting the assessment of technical and commercial proposals from telecommunications equipment vendors, satellite providers and infrastructure suppliers.

Develop technology trial agreements, Memorandums of Understanding (MoUs) and supporting documentation for the evaluation of new telecommunications products and services.

Participate in strategic supplier negotiations and contract development activities, gaining exposure to the commercial, technical and operational considerations involved in large-scale telecommunications networks.

Work closely with engineering, legal, procurement and commercial stakeholders to ensure network technology decisions delivered both technical and business value.

Technology Discovery and Validation (June 2025 – June 2026)

Design and develop technology demonstrations showcasing the application of 5G, edge computing, robotics and artificial intelligence solutions over Telstra's mobile network for enterprise customers across industries including healthcare, mining and public services.

Develop software and hardware prototypes incorporating computer vision, machine learning, robotics and embedded systems to demonstrate practical applications of advanced telecommunications technologies.

Engineer AI-based vision systems for autonomous robotic platforms, enabling real-time object recognition, tracking and decision-making while communicating across the mobile network.

Plan and execute validation activities for new network features, devices and services through structured test methodologies, data collection and performance analysis.

Conduct testing of High-Powered User Equipment (HPUE) devices for public safety and mission-critical communication use cases, assessing coverage, capacity and service performance outcomes.

Network Optimisation (June 2026 – present)

Analyse radio access network (RAN) performance using engineering tools and network KPIs to identify coverage, capacity and service quality issues across 4G and 5G networks.

Support the validation and integration of new mobile sites and network upgrades through performance assessment, post-integration reviews and acceptance activities.

Develop an understanding of radio frequency (RF) engineering principles, cellular network architecture, spectrum utilisation and optimisation techniques used in large-scale mobile networks.

Collaborate with planning, deployment and operations teams to improve customer experience through data-driven network optimisation and continuous performance improvement initiatives.

Yours sincerely,

Sima Salahifar
